

IBA Hamburg International Building Exhibition

Building the City Anew

Shaping the future of the city in the 21st century... This is a challenge that has been taken up by the IBA Hamburg International Building Exhibition, with projects that make an innovative and sustainable contribution to current issues of urban development.

Between now and 2013 and in the heart of the Hanseatic city, IBA Hamburg will be staging 70 social, cultural and building-related projects and programmes as a blueprint for the 21st century, showing how the metropolis can continue to grow in a socially and ecologically balanced way.

The IBA project occupies an area of 35 square kilometres on Hamburg's Elbe islands of Wilhelmsburg and Veddel and in the Harburg Upriver Port. It aims to be a model of sustainable and future-oriented inner city development. This is an area inhabited by 55,000 people of more than 100 different nationalities.

Sustainable impulses for the development of the city

Following a review of Hamburg's municipal development at the start of the 21st century, Hamburg's Elbe islands acquired new importance in planning terms. They now represent a crucial springboard for the leap over the Elbe between the Hafencity district in the north and Harburg in the south. With a view to encouraging the realisation of the leap project, IBA Hamburg GmbH [IBA Hamburg & Co. Ltd.] was founded as a 100 percent subsidiary of the Free and Hanseatic City of Hamburg. Based on the development of an innovative municipal agreement, the IBA Convention, more than 100 IBA partners are now supporting the work of the company. Nearly 40 private investors have also been found to back the scheme,

investing more than 700 million euros in projects for the future of the metropolis. Till 2013 1.217 dwellings are under construction or have been completed. Additional 516 dwellings were modernized. There are also more than 100,000 m² of commercial space, eight schools, two senior housing and nursing homes, four kindergartens, four sports facilities, a commercial park, a center for artists and creative people, the extension of the Assmann channel and over 70 hectares of green areas. Processes triggered by the International Building Exhibition should result in even greater potential for residential building in the project area in the years up to 2020, amounting to another 5000 new dwellings or more.

International building exhibitions and IBA Hamburg

International building exhibitions have been a major tradition in Germany since 1901, in terms of both municipal planning and building culture. They have always been more than just exhibitions, engaging at all times with current contemporary challenges.

The Free and Hanseatic City of Hamburg launched the IBA in 2006, with the aim of initiating **Building the City Anew** and providing this with a conceptual underpinning, based on new strategies connected with three topical and internationally discussed urban development themes. The first of these relates to the question of the future shape of shared living in an urban society that is becoming more international and multicultural all the time. This guiding ideal goes by the name of the **Cosmopolis**. The second guiding ideal, **Metrozones** aims to highlight the often concealed potential of the **inner city periphery**. And finally with its third headline project, **City in Climate Change** IBA Hamburg tackles the question how to balance the requirements of urban growth and climate conservation.

Headline topics and projects of IBA Hamburg

Cosmopolis . New Opportunities for the City

Projects under this heading fall in three areas of activity.

The central focus is on education. Not only is an educational offensive looking into new pedagogical and conceptual approaches to improving the educational situation in districts dominated by immigration; new trail-blazing educational facilities like the Tor zur Welt [Gate to the World] training centre have also been set up under the auspices of IBA Hamburg.

Other projects, like those of the Elbe Island Creative Quarter focus on living and living space, and demonstrate how conditions of life can be improved for the local population and how new models of urban neighbourhoods can function. Projects like the Weltquartier urban renovation project, which was enthusiastically supported by neighbourhood residents, and the Veringhöfe Nord artists studios have also shown how local residents and businesses can be actively involved in the planning process and contribute to the shaping of their environment.

Metrozones . New Spaces for the City

IBA Hamburg's presentation area amounts to a patchwork measuring 35 square kilometres . between the city and port, between quiet and hubbub, between green spaces and grey transport axes. The motorways and railway lines cut right across the Elbe islands in a north-south direction. So the aim is to create spaces based on existing hiatuses and breaks in the urban network, such as multi-lane highways, marshland and empty industrial areas, with a view to toning down sharp contrasts. Such places would represent a new form of urban culture, depending on the unique qualities of Europe's largest river island . the inner city landscape and the scenic variety of the watery setting.

The centrepiece of IBA's plans under this heading is the Wilhelmsburg Mitte [Central Wilhelmsburg] project, the showcase specimen scheduled for IBA Hamburg in 2013. An important component in this is the building exhibition within the building exhibition presenting innovative solutions for aesthetically ambitious and at the same time cost-effective, adaptable and sustainable buildings.

17 buildings were built on an area of about two hectares . including three Hybrid Houses, four Smart Material Houses, five Smart Price Houses and five Water Houses with a total of 179 residential units.

The new Wilhelmsburg Mitte centre not only touches on the future New Style Public Park of Hamburg's International Garden Show 2013 (igs 2013), it also combines with the latter to form a central point of departure for the forward-looking development of this district of the city.

One of the crucial measures for the upgrading of the Wilhelmsburg metrozone is the relocation of the Wilhelmsburger Reichsstrasse (the B4/B75 highway). This is a four-lane city thoroughfare, one of three big severing transport axes. Only on this basis will it be possible to create attractive green areas and fluvial spaces on a wide scale in the centre of the island, so giving the leap over the Elbe somewhere to spring to.

Cities and Climate Change - New Energies for the City

In view of its position in the heart of the area where the Elbe's current divides, this location is more suitable than any other to represent issues of preventive and adaptive climate protection. Ever since the island was first inhabited, flooding has been a constant risk . a risk highlighted by the overwhelming flood disaster of February 1962. So there is an imperative need in Wilhelmsburg of new strategies for dealing with floods, rising ground water levels and heavy rain conditions. But model urban development strategies for CO₂-neutral building are no less in demand. So IBA

has devised a climate protection scheme under the heading **Renewable Wilhelmsburg** hoping this will serve as a basis for the gradual switchover to supplying energy to the Elbe islands on a completely regenerative basis. For this reason IBA Hamburg follows a practice of climatically friendly building, and relies on domestic and sustainable sources of energy. For example, the wind power plant on the former landfill site in Georgswerder is being **revitalised**. Its output is being boosted and supplemented by a big photovoltaic system. A one-time flak bunker, an internally decayed relic of the Second World War, is being converted to an **energy bunker** with the help of solar collectors and a gigantic water reservoir. In future it should be able to supply clean energy to around 3000 homes in the adjacent city district.

Finally there is the IBA DOCK . IBA Hamburg's central exhibition and office building, presented last year as its first innovative construction project. This not only adapts to the changing water levels in the tidal Muggenburger Zollhafen port, it even generates its own supply of CO₂-neutral heating.

Status of IBA projects and the IBA presentation year 2013

Of the 63 structural IBA projects, 54 have already been completed. Two projects are in delay and seven projects will be completed in time till 2015. Also there are seven cultural, social and ecological projects.

During the presentation year 3.500 guided tours took place, the IBA presented twelve exhibitions, 40 conferences und congresses as well as 80 events. Furthermore there were more than 1.700 bus trips with IBA bus through the project area of the International Building Exhibition IBA Hamburg.

Status: November 2013
